NOMENCLATURE

SR AH - 700 LP - HS

Type:

HZ: Horizontal
HS: Horizontal Sectional
HY: Hygienic
MZ: Multi-Zone
AW: Air Washer

AW4: class 4
AW6: class 6
AW8: class 8

Total Pressure Rate:

LP: Low Pressure (<2.5IN.WG)
HP: High Pressure (>2.5IN.WG)

Model

Air Handling Unit

SARAN

Introduction

Saran air handling unit are designed and manufactured to meet the precise environmental demands of various applications from small office premises to larger industrial applications.

This units are suitable for both indoor and outdoor installations and are a perfect choice for hotels, shopping centers, office buildings, hospitals, residential and industrial buildings. All components of units selected from reliable and famous international brands or designed and constructed base on international air-conditioning equipment's standards.

Saran air handling unit available in 15 sizes covering a flow range from 2500 to 45000 CFM and up to a total static pressure of 5 IN.W.G. (For flow rate and total static pressure upper than standard, please send your inquiry to Saran MFG group).

Saran air handling unit has five major series such as Standard, Sectional, Hygienic, Multi-Zone and Air Washers (Saran air washer are available in the three different classes (4, 6 and 8) to meet the need of industry to clean humidity air).

Main Features:

- Single and multi-zone design
- Ability to variable fan selection include forward-curved, backward-curved and airfoil
- High efficiency cooling and heating coil design
- Ability to variable heating coil selection include Steam, Hot water and Electrical heater
- Ability to variable cooling coil selection include Chilled water, DX coil or Air washer system
- Low energy consumption and low risk of housing condensation due to quality thermal insulation and air-tightness of housing
- Anti-corrosion coated, double sloped drain pan
- Low leakage damper
- Equipped with standard mixing box and aluminum washable pre filters
- Ability to selection different type fine filter with grade range of EU2 to EU11
- Ability to equipped with variable frequency drive / Frequency inverter (VFD) and thermistor
- Ability to equipped with steam, water spray or electrical humidifier
- Accessible and maintenance
- Flexibility section for shipment

Component Features

Casing:

The air handling unit is constructed from framed modules manufactured from extruded anodized aluminum profiles joined by means of 3D injected molded and reinforced PE corners to form the "Penta-post" construction. This method has demonstrated superior mechanical characteristics and gives the unit its rigidity and design flexibility. The unique profiles with their unique cross sections designed to give extra strength and rigidity to the unit frame and to prevent any buckling or deformation.

As standard, the unit wall are made up by 40mm thickness double skin polyurethane foam (PU) insulation panel with 0.5 mm high strength pre-painted galvanized steel as internal and external skin.

Fan Assembly:

The standard used fans in Saran air handling units are high performance double width double Inlet (DWI) centrifugal fans, optimally engineered for HVAC application, with high quality, and fully tested performance according to international standards.

All fans are optimally selected for best performance and sound characteristics based on maximum fan efficiency. The impellers can have forward curved, backward inclined or airfoil profile blades depending on the customer requirement and the system static pressure.

The impeller is galvanized finished for forward curve blade; glass reinforced polyamide or welded heavy gauge steel painted with epoxy for backward and airfoil blade. Fans housings are made of galvanized steel and shafts are made of carbon steel (CK45) and are precision machined to provide an accurate fit with the fan bearings and the wheel hub. All fans are statically and dynamically balanced for stable non-surge operation.

Other power transmission components such as pulleys and belts are suitably chosen depending on the required fan speed and electric motor power and pre-installed by factory. Fan(s) and the corresponding electric motor(s) are installed on an independent chassis which is itself installed on the main chassis using vibration dampers in order to eliminate transfer of vibrations to the structure to further reduce the effects of vibrations, fan outlet (s) are also connected to the structure via flexible material such as canvas.

For reducing power consumption or hygienic application, high efficient plug fans are also available upon request.

Motor:

Motors are totally enclosed, fan cooled (TEFC) squirrel cage type with class "F" insulation at 104°F ambient temperature and continuous duty. Motors are of IP54 and protect the motor from dust and water. For motor sizing the mechanical losses incurred in transmitting the load from motor shaft to the fan shaft are taken into consideration along with a reasonable safety factor. Electric motors with ingress protection of (IP- 55) and VFD for motor are also available upon request.

Drain Pan:

In order to remove the condensate, dropped-out during dehumidification, the drain pan is supplied under the cooling coil, cover the entire coil section. The drain pan, as standard, is made of galvanized steel sheet protected with powder coating paint or stainless steel as option.

Filters:

As standard, Saran air handling units equipped with panel type aluminum washable pre-filter which efficiency is G2. They are arranged in V-type and installed in the track on the air inlet frame and can be drawn out from access side's door for check and maintenance. Other type of filters such as Pleated, Bag, Rigid V-Cell, HEPA, ULPA and Carbon Active filters available upon request (For more information about filter types and its class, please refer to Appendix 2)

Dampers:

Saran air handling units are equipped with heavy duty, airfoil, opposed type, aluminum blade, dampers to modulate and control the air flow of return and fresh air. Airfoil blades offer low pressure drop performance and are ideal for high velocity and pressure applications. Dampers are prepared for either manual or motorized operation (motor can be provided as an option). Supply air damper are also available upon request.

Coils:

All coils designed to deliver their respective duties at optimum performance at all design conditions and to meet a wide range of applications and requirements.

As standard, coils are manufactured from seamless copper tubes of 5/8" OD (Some type of DX coil may be manufactured from seamless copper tubes of 3/8" OD), mechanically expanded into collar continuous corrugated aluminum fins to provide a continuous compression bond over the entire finned length for maximum heat transfer rates. The standard fin spacing is 8 and 14 FPI; however, 10 and 12 FPI are available as an option upon the client request or to achieve the determined indoor conditions. Cleaning process is done after manufacturing each coil for optimum system cleanliness and all coils are factory tested at 200 psig.

Direct expansion coils are equipped with a properly sized expansion valve and distributor to ensure equal refrigerant fed to all circuits. The number of circuits is chosen to provide optimum heat transfer and reasonable refrigerant velocity and pressure drop so as not to trap any oil in the coil tubing.

Headers and connections for water coils and DX-coils are made of seamless copper pipes, and inlet and outlet connections are sealed against unit panels by rubber gaskets as standard wherever coil connections protrude through the casing. All water coils are fitted with plugged drain and vent tapping to facilitate draining and venting.

Other type of coil such as coil with copper fin or Hydrophilic fin (Golden Fin), Steam heating coil and Electrical heater available upon request.

Options and additional features:

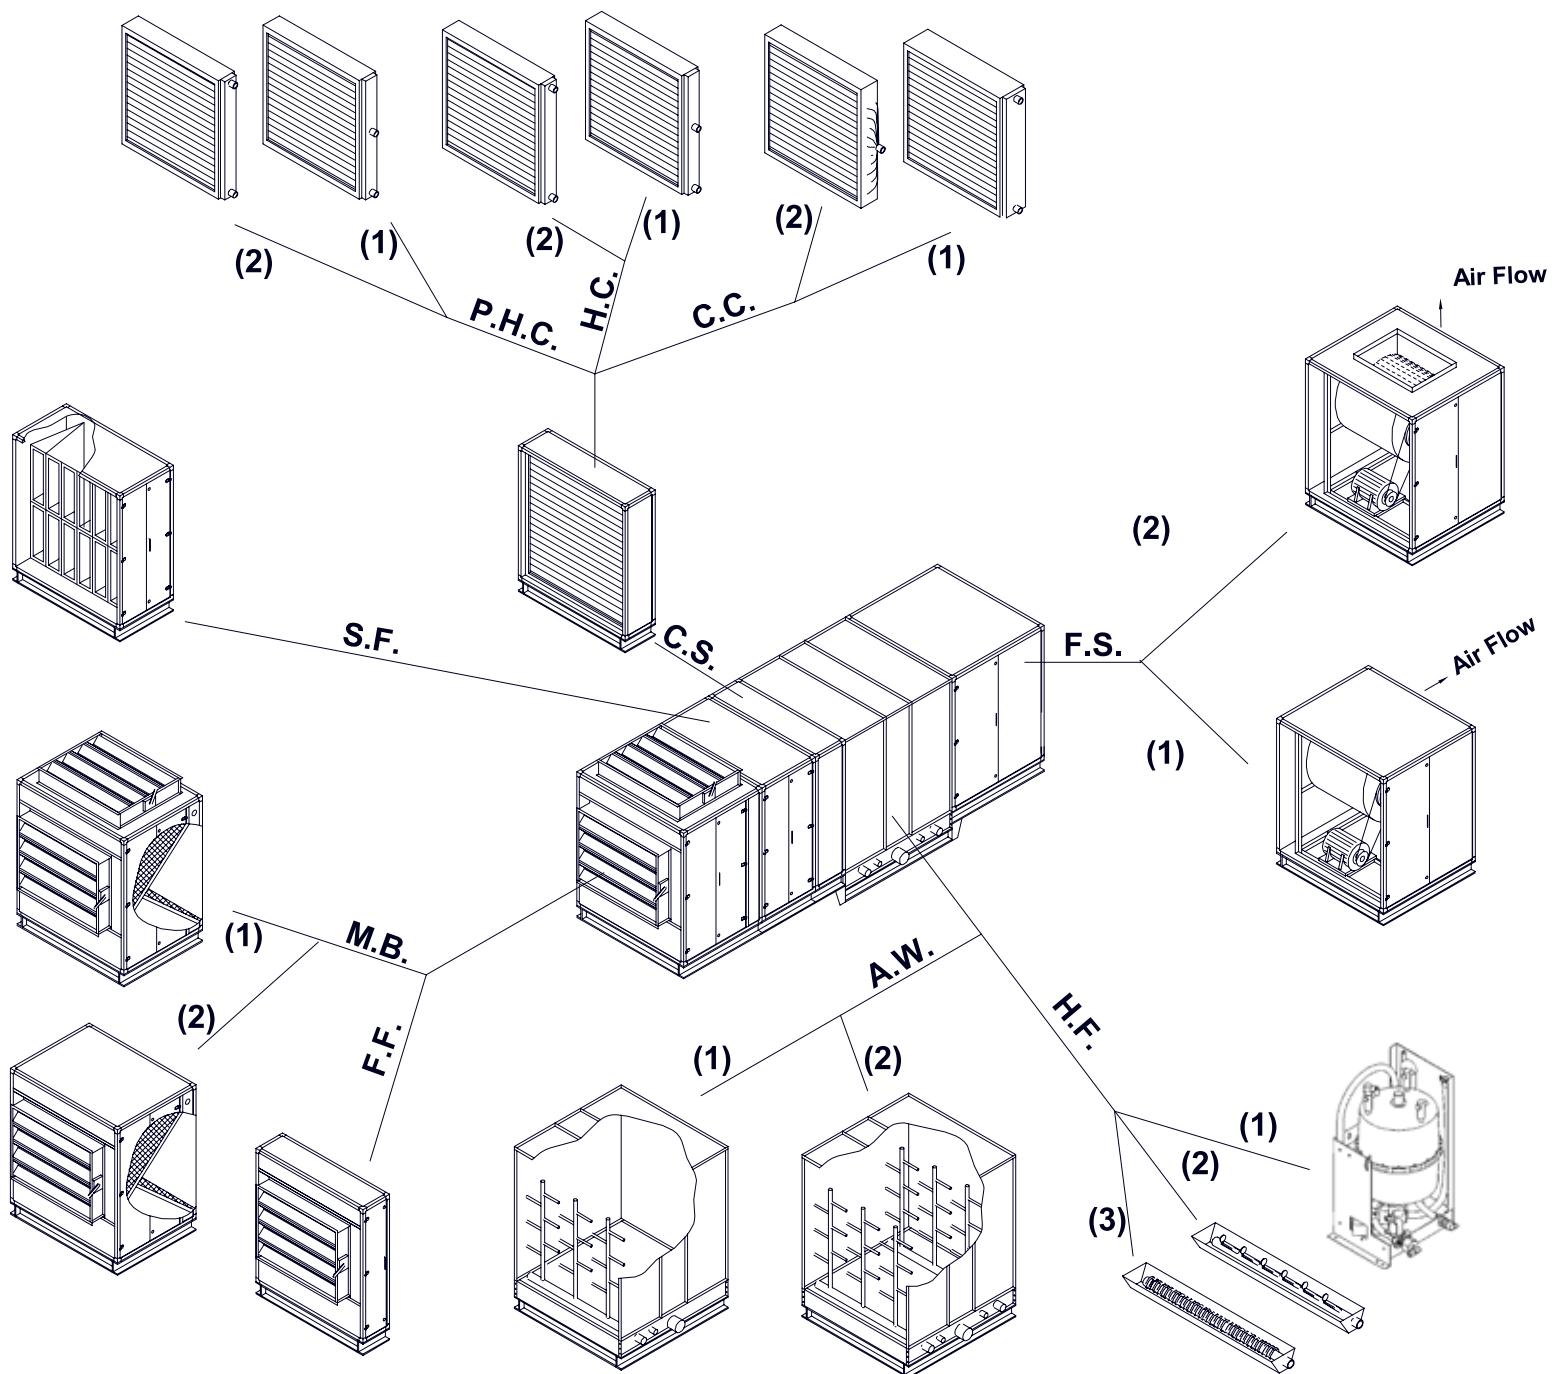

All type air handling units can be equipped with:

- Fans with star delta running motors
- Fans with direct-drive motors and inverter
- Heating section with working fluid – steam
- All type of humidifier (such as Electronic Steam, Spray Nozzle and Steam Grid)
- Sections with increased insulation thickness (50mm) or other type insulation (such as rock wool and polyethylene)
- Anti-frost protection of water sections
- Dirty filter signalization
- 3-way valves with actuator for heating and cooling sections
- Air temperature and/or humidity sensor
- Internal light and inspection windows
- Electric board for control and automation
- Hygienic air handling units special consideration (such as Smooth inside surface design, Thermal break profile, Air tight dam  www.famcocorp.com,  E-mail: info@famcocorp.com,  [@famco_group](https://www.instagram.com/famco_group))

Air Handling Unit Configurations Overview

F.S. (Fan Section)

- 1- Top Horizontal Discharge
- 2- Up Blast Discharge

C.S. (Coil Section)

P.H.C. (Pre-Heating Coil)

- 1- Steam
- 2- Hot Water

H.C. (Heating Coil)

- 1- Steam
- 2- Hot Water

C.C. (Cooling Coil)

- 1- Chilled Water
- 2- DX Coil

S.F. (Special Filter)

- 1- Pleated and bag filter

M.B. (Mixing Box)

- 1- With fresh and return air dampers
- 2- With fresh or return air dampers
(V Type filter arrangement)

F.F. (Flat Filter)

A.W. (Air Washer)

- 1- With one spray bank (Class 4, 6)
- 2- With two spray bank (Class 8)

H.F. (Humidifier)

- 1- Electronic Steam
- 2- Spray Nozzle
- 3- Steam Grid

Selection Example

Given

Required Air Flow Rate: 11000 CFM
 Ambient Altitude: Sea level
 External Static Pressure Drop = 0.76 IN.W.G

Summer Conditions

Total Cooling Load: 470,000 Btu/hr
 Sensible Cooling Load: 320,000 Btu/hr
 Entering Air Temperature: 80°F DB / 67°F WB
 Entering/Leaving Water Temperature: 45°F / 55°F

Winter Conditions

Total Heating Load: 450,000 Btu/hr
 Entering Air Temperature: 60°F DB
 Entering/Leaving Water Temperature: 160°F / 140°F

Step1: Appropriate Air Handling Unit Model and Coil Selection

Considering the required airflow rate, we select SRAH-1000 from air handling unit models.

By referring to performance tables, we can see total and sensible cooling capacity of this unit with 6Rows/14FPI cooling coil in given summer conditions (QTotal = 468 MBH and QSensible = 313 MBH) and 2Rows/8FPI heating coil in given winter conditions (QTotal = 585 MBH) are satisfied our requirements.

Step2: Performance Adjustment Factors Consideration

Because of Saran air handling unit rating data presented in the "Performance Data" tables indicate capacity of them at standard condition, for other condition, indicated performance adjustment factor in table 7 to 11 shall be attend in air handling unit selection based on requirements, so to determine the performance adjustment factor in this problem, we use the following procedure:

- Non Standard Air Flow Rate Correction Factors (C1)**

The ratio of Actual Air Flow Rate (11000 CFM) to Nominal Air Flow Rate of selected unit (10000CFM) is 1.1, so by referring to table 7, Non standard air flow rate correction factors for cooling and heating capacity are 1.03 and 1.05, respectively.

- Fin Spacing Correction Factors (C2)**

This Correction Factor is 1.00 in this problem.

- Entering Hot Water Temperature Correction Factors (C3)**

Base on given data, desired entering hot water temperature in this problem is 160°F, so by referring to table 9, its correction factor is 0.75.

- Entering Chilled Water Temperature Correction Factors (C4)**

Base on given data, desired entering chilled water temperature in this problem is 45°F, so by referring to table 10, its correction factor is 1.00.

- Steam Pressure Correction Factors (C5)**

Because of in this problem do not have steam coils, we ignore this correction factor.

Finally, based on above, we have:

$$\text{Actual Total Cooling Capacity} = 468 \times 1.03 \times 1.00 \times 1.00 = 482 \text{ MBH}$$

$$\text{Actual Sensible Cooling Capacity} = 313 \times 1.03 \times 1.00 \times 1.00 = 322.4 \text{ MBH}$$

$$\text{Actual Heating Capacity} = 585 \times 1.05 \times 1.00 \times 0.75 = 460.7 \text{ MBH}$$

Therefore, the chosen unit satisfies the load requirements.

Step3: Leaving Air Temperature Determining

To determine the leaving air temperature of selected unit in previous steps, we can use following procedure:

Heating Mode Leaving Air Temperature:

$$\text{Temp.Difference } (^{\circ}\text{F}) = \frac{\text{Heating Capacity (MBH)} \times 1000}{1.085 \times \text{Actual Air Flow Rate (CFM)}} = \frac{460.7 \times 1000}{1.085 \times 11000} = 38.6 \text{ } ^{\circ}\text{F}$$

Therefore, leaving air temperature in heating mode will be:

$$\text{Leaving Air Temp.} = \text{Entering Air Temp.} + \text{Temp. Difference} = 60 + 38.6 = 98.6 \text{ } ^{\circ}\text{F}$$

Cooling Mode Leaving Air Temperature:

$$\text{Dry Bulb Temp.Difference } (^{\circ}\text{F}) = \frac{\text{Sensible Cooling Capacity (MBH)} \times 1000}{1.085 \times \text{Actual Air Flow Rate (CFM)}} = \frac{322.4 \times 1000}{1.085 \times 11000} = 27 \text{ } ^{\circ}\text{F}$$

$$\text{Enthalpy Difference (Btu/hr)} = \frac{\text{Total Cooling Capacity (MBH)} \times 1000}{4.5 \times \text{Actual Air Flow Rate (CFM)}} = \frac{482 \times 1000}{4.5 \times 11000} = 9.7 \text{ Btu/hr}$$

$$\text{Leaving Air Enthalpy} = \text{Entering Air Enthalpy (Table 24)} - \text{Enthalpy Difference} = 31.6 - 9.7 = 21.9 \text{ Btu/hr}$$

Therefore, leaving air temperature in cooling mode will be:

$$\text{Leaving Air DB Temp. } (^{\circ}\text{F}) = \text{Entering DB Air Temp. } (^{\circ}\text{F}) - \text{DB Temp. Difference } (^{\circ}\text{F}) = 80 - 27 = 53 \text{ } ^{\circ}\text{F}$$

$$\text{Leaving Air WB Temp. } (^{\circ}\text{F}) = \text{Corresponding WB Temp. of Leaving Air Enthalpy (Table 24)} = 52.8 \text{ } ^{\circ}\text{F}$$

Step4: Air Side Pressure Drop Determining

To determine the air side pressure drop, first, divide the air flow rate by units coil face area (table12) to obtain the coil face velocity:

$$\text{Coil Face Velocity} = \frac{\text{Air Flow Rate (CFM)}}{\text{Coil Face Area (Sq Ft)}} = \frac{11000}{20.7} = 531 \text{ FPM}$$

In next step, with calculated coil face velocity, we can determine the total internal air side pressure drop of selected air handling unit from table 16 to 18:

Cooling Coil (Table 16)	1.037 IN.W.G
+ Heating Coil (Table 16)	+ 0.189 IN.W.G
+ Aluminum Washable Filter (Table 17)	+ 0.100 IN.W.G
+ Mixing Air (Table 17)	+ 0.060 IN.W.G
+ Damper (Table 17)	+ 0.050 IN.W.G
Internal Pressure Drop	1.436 IN.W.G
+ External Pressure Drop	+ 0.760 IN.W.G
Total Pressure Drop	2.196 IN.W.G

Step5: Fan RPM and Motor Power Calculation

By referring to table19 and performing interpolation based on required air flow rate and determined air side pressure drop in previous step, we can see the required fan speed and motor power is 660 RPM and 9.11HP (10HP) , respectively.

Step6: Water Side Pressure Drop Determining

To determine the water side pressure drop, first, determine required water flow rate in the coils based on required cooling and heating capacities and then based on determine water velocity inside the coils tube, so we have:

- Determine the water side pressure drop (Cooling Coil)

$$\text{Chilled water flow rate} = \frac{\text{Required Cooling Capacity (Btu/hr)}}{500 \times \text{Water Temperature Difference (°F)}} = \frac{470000}{500 \times 10} = 94 \text{ GPM}$$

$$\text{Water velocity inside the tubes} = \frac{\text{Chilled water flow rate (GPM)}}{\text{No. of coils} \times \text{No. of circuits (Table 12)}} \times 1.2$$

$$\text{Water velocity inside the tubes} = \frac{94}{1 \times 29} \times 1.2 = 3.9 \text{ FPS}$$

By referring to table 15, we can see pressure drop of selected cooling coil (6 Rows Coil) in determined water velocity is 8.6 Ft. W.G.

- Determine the water side pressure drop (Heating Coil)

$$\text{Hot water flow rate} = \frac{\text{Required Heating Capacity (Btu/hr)}}{500 \times \text{Water Temperature Difference (°F)}} = \frac{450000}{500 \times 20} = 45 \text{ GPM}$$

$$\text{Water velocity inside the tubes} = \frac{\text{Chilled water flow rate (GPM)}}{\text{No. of coils} \times \text{No. of circuits (Table 12)}} \times 1.2$$

$$\text{Water velocity inside the tubes} = \frac{45}{1 \times 29} \times 1.2 = 1.9 \text{ FPS}$$

By referring to table 15, we can see pressure drop of selected heating coil (2 Rows Coil) in determined water velocity is 1.67 Ft.W.G. By consideration of average water temperature correction factor (table14), the actual heating coil water pressure drop will be 1.3 Ft.W.G.

Performance Data

NOTE

- 1MBH = 1000 Btu/hr
- EDB = Entering air dry bulb temperature
- LVG = Leaving air temperature
- All above data are based on entering / leaving hot water temperature of 180°F / 160°F.
- Interpolation is allowed but extrapolation outside table boundary is not allowed. Contact Saran MFG group for operating conditions outside table boundary.
- The above data is subject to change without notice.

NOTE

- 1MBH = 1000 Btu/hr
- EDB = Entering air dry bulb temperature
- LVG = Leaving air temperature
- All above data are based on 45°F evaporator temperature and 14 FPI coil fin spacing.
- Interpolation is allowed but extrapolation outside table boundary is not allowed. Contact Saran MFG group for operating conditions outside table boundary.
- The above data is subject to change without notice.

- All above data are based on steam pressure of 5 PSIG and 8 FPI coil fin spacing.
- Interpolation is allowed but extrapolation outside table boundary is not allowed. Contact Saran MFG group for operating conditions outside table boundary.
- The above data is subject to change without notice.

Selection Considerations

Saran air handling unit rating data presented in the "Performance Data" tables indicate capacity of them at standard condition, so for other condition, following performance adjustment factors shall be attend in air handling unit selection:

Table 7: Non Standard Air Flow Rate Correction Factors (C1)

Actual CFM / Nom. CFM	0.7	0.8	0.9	1.0	1.1	1.2	1.4
Cooling Coil	0.86	0.92	0.95	1.00	1.03	Not Recommended	
Heating Coil	0.80	0.88	0.93	1.00	1.05	1.11	1.19

Table 8: Fin Spacing Correction Factors (C2)

No of Rows	Fin Spacing		
	8 FPI	10 FPI	12 FPI
4	1.00	1.10	1.19
6	1.00	1.08	1.15
8	1.00	1.06	1.10

NOTE

- To determine capacity of coils with 10 or 12 FPI fin spacing, multiply the capacity of unit in 8 FPI fin spacing performance rating table to above correction factors.

Table 9: Entering Hot Water Temperature Correction Factors (C3)

Entering Hot Water Temp. (°F)	160	180	200	220
Heating Capacity Correction Factor	0.75	1.00	1.25	1.50

Table 10: Entering Chilled Water Temperature Correction Factors (C4)

Entering Chilled Water Temp. (°F)	42	44	45	46
Cooling Capacity Correction Factor	1.09	1.04	1.00	0.97

Table 11: Steam Pressure Correction Factors (C5)

Steam Pressure (psig)	2	5	10	15	20	30	40	50	60
Heating Capacity Correction Factor	0.95	1.00	1.07	1.14	1.19	1.28	1.35	1.42	1.48

Water Coils Engineering Data

Table 12: Coils Face Area

Model	Qty	Coil Data						Height (In)	Length (In)	Total Coil Face Area (Sq Ft)
		1 Rows	3 Rows	Other						
250	1	8	12	15	23.6	30.7	5.0			
350	1	11	16	21	32.5	30.3	6.8			
500	1	12	18	24	36.9	38.2	9.8			
700	1	14	21	27	41.3	47.6	13.7			
1000	1	15	22	29	44.3	67.3	20.7			
1250	2	9	13	17	26.6	67.3	24.8			
1500	2	11	16	21	32.5	67.3	30.4			
1750	2	11	16	21	32.5	77.2	34.8			
2000	2	11	17	22	34.0	87.0	41.0			
2250	2	11	17	22	34.0	92.9	43.8			
2500	2	12	18	23	35.4	102.4	50.4			
	4*	12	18	23		51.2				
3000	4	11	16	21	32.5	64.6	58.3			
3500	4	11	16	21	32.5	74.4	67.1			
4000	4	11	17	22	34.0	84.3	79.5			
4500	4	11	17	22	34.0	90.2	85.0			

NOTE

* Air handling unit with 6 or 8 Rows Coil (In this case, coils connections are in both sides of AHU).

Table 13: Coils Connections Sizes (Inch)

Model	No. of Coils	Chilled Water			Hot Water				Steam			
		4Rows	6Rows	8Rows	1Row	2Rows	3Rows	4Rows	1Row	2Rows	1Row	2Rows
		1 1/4	1 1/2	1 1/2	1	1	1 1/4	1 1/4	1 1/2	1 1/2	1 1/4	1 1/4
250	1	1 1/4	1 1/2	1 1/2	1	1	1 1/4	1 1/4	1 1/2	1 1/2	1 1/4	1 1/4
350	1	1 1/2	2	2	1 1/4	1 1/4	1 1/2	1 1/2	1 1/2	1 1/2	1 1/4	1 1/4
500	1	2	2	2	1 1/4	1 1/4	1 1/2	1 1/2	2	2	1 1/2	1 1/2
700	1	2	2	2 1/2	1 1/2	1 1/2	2	2	2	2	1 1/2	1 1/2
1000	1	2	2 1/2	2 1/2	1 1/2	1 1/2	2	2	2	2	1 1/2	1 1/2
1250	2	2	2	2 1/2	1 1/2	1 1/2	2	2	2	2	1 1/2	1 1/2
1500	2	2	2	2 1/2	1 1/2	1 1/2	2	2	2	2	1 1/2	1 1/2
1750	2	2 1/2	2 1/2	2 1/2	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2
2000	2	2 1/2	2 1/2	2 1/2	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2
2250	2	2 1/2	2 1/2	2 1/2	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2
2500	2	2 1/2	-	-	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2
	4*	-	2	2 1/2	1 1/2	1 1/2	2	2	2	2	1 1/2	1 1/2
3000	4	2	2	2 1/2	1 1/2	1 1/2	2	2	2	2	1 1/2	1 1/2
3500	4	2 1/2	2 1/2	2 1/2	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2
4000	4	2 1/2	2 1/2	2 1/2	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2
4500	4	2 1/2	2 1/2	2 1/2	1 1/2	1 1/2	2	2 1/2	2	2	1 1/2	1 1/2

NOTE

The coils data are different in air washer and multi zone air handling unit (for more information contact Saran MFG).

* In this case, coils connections are in both sides of AHU.

Table 14: Coil Water Side Pressure Drop Correction Factors

Average Water Temperature (°F)	40	50	60	80	100	120	140	150	160	180	200	220
Correction Factor	1.04	1	0.96	0.90	0.86	0.83	0.80	0.78	0.77	0.76	0.74	0.73

	2	0.07	0.11	0.12	0.16	0.17	0.23	0.23	0.29	0.3	0.37
	3	0.09	0.16	0.15	0.24	0.22	0.34	0.3	0.44	0.39	0.49
	4	0.16	0.21	0.19	0.32	0.27	0.45	0.37	0.59	0.47	0.6
	5	0.15	0.26	0.23	0.4	0.34	0.57	0.46	0.74	0.59	0.75
	6	0.18	0.31	0.27	0.48	0.4	0.68	0.55	0.88	0.71	0.9
	8	0.23	0.41	0.37	0.65	0.55	0.87	0.73	1.18	0.95	1.2
14 FPI	1	0.06	0.08	0.09	0.11	0.12	0.15	0.17	0.21	0.23	0.27
	2	0.11	0.15	0.19	0.22	0.26	0.32	0.34	0.41	0.45	0.56
	3	0.14	0.22	0.2	0.33	0.33	0.47	0.45	0.62	0.59	0.74
	4	0.16	0.28	0.3	0.43	0.41	0.63	0.56	0.83	0.71	0.9
	5	0.24	0.35	0.36	0.55	0.51	0.79	0.69	1.04	0.89	1.13
	6	0.29	0.42	0.42	0.65	0.6	0.95	0.83	1.23	1.1	1.35
	8	0.37	0.55	0.58	0.88	0.83	1.21	1.1	1.65	1.43	1.8

NOTE

- Use "Dry" values for heating coils pressure drop determining and "Wet" values for cooling coils pressure drop determining.
- For coils with 10FPI and 12FPI fin spacing, multiply the values of 8FPI in 1.16 and 1.32, respectively.

APPENDIX 1 - Saran Air Washer

Air washer, as their name implies, not only remove dust and dirt from the air, but also perform necessary heat transfer functions such as humidification and cooling.

Saran air washers basically consist of a casing containing a spray system. A tank at the bottom for collecting the spray water, and an eliminator section at the leaving end of the unit for the removal of water droplets entrained in the air. Air is drawn into the air washer casing through entry louvers, which smooth out the air flow and, at the same time, prevent any backlash of spray water from falling outside the unit. Water sprays covering the entire area of the unit wash of air clean of dust, dirt and fumes. The cleaned air then passes through the eliminators which trap the droplet of moisture carried over from the spray system.

Saran air washer are available in the three different classes (4, 6 and 8) to meet the need of industry to clean humidity air.

Class 4:

A compact and economical single spray bank air washer specially designed for effective humidifying and air washing purposes.

Class 6:

A single spray bank unit for medium capacity applications, the ideal air washer for most types evaporative cooling and air washing tasks.

Class 8:

A highly efficient heavy duty unit with two spray banks used whenever the utmost in heat transfer, humidification or air cleaning is required.

In all classes, casing are constructed of galvanized steel sheet and braced with galvanized steel angle with all joints and angle braces riveted to prevent water leakage. Entry and leaving end of the air washer have a flanges with holes ready drilled suitable for air handling unit sections.

Tanks are 300 mm deep for class 4 and 400 mm deep for class 6&8 and are heavily coated with anti-corrosion coat. A quick fill connection varying from 3/4" to 1", depending upon the size of the air washer, is provided for connection to fresh water supply. A make-up water connection with an automatic float valve is also provided to maintain a suitable level of water in the tank. All air washer are furnished complete with over flow and overflow line. An access door and frame made galvanized steel is provided on all air washers and each door has a glass inception window.

APPENDIX 1- Saran Air Washer (Cont.)

Air Washer Selection Example:

Given:

Required Air Flow Rate: 10000 CFM

Ambient Altitude: Sea level

Required Sensible Cooling Load: 270,000 Btu/hr

Entering Air Temperature: 95°F DB / 63°F WB

Step1: Appropriate Air Handling Unit Model Selection

Considering the required airflow rate, we select SRAH-1000 from air handling unit models.

Step2: Air Washer Efficiency Calculation

For Air Washer model selection, in first, we need to calculate required air washer efficiency (evaporative cooling efficiency), so we have:

$$\text{Leaving Air DB Temp.} = \text{Entering Air DB Temp.} - \frac{\text{Sensible Cooling Load (Btu/hr)}}{1.085 \times \text{Air Density Factor (Table 27)} \times \text{Air Flow Rate (CFM)}}$$

$$\text{Leaving Air DB Temp.} = 95 - \frac{270000}{1.08 \times 10000} = 70^{\circ}\text{F}$$

$$\text{Air Washer Efficiency} = \frac{\text{Entering Air DB Temp.} - \text{Leaving Air DB Temp.}}{\text{Entering Air DB Temp.} - \text{Entering Air WB Temp.}} = \frac{95 - 70}{95 - 63} = 0.78$$

Step3: Air Washer Model Selection

In this step, we select appropriate air washer based on calculated air washer efficiency in previous step, so in first, we need to calculate air face velocity based following formula:

$$\text{Face Velocity} = \frac{\text{Air Flow Rate (CFM)}}{\text{Coil Face Area (Sq Ft)}} = \frac{10000}{19.6} = 510 \text{ FPM}$$

Then, by referring to table 26, we can see evaporative cooling efficiency of class 8 air washer in calculated face velocity is 0.898, therefore, this model satisfies our requirement.

Actual leaving air temperature and sensible cooling load based on selected air washer will be:

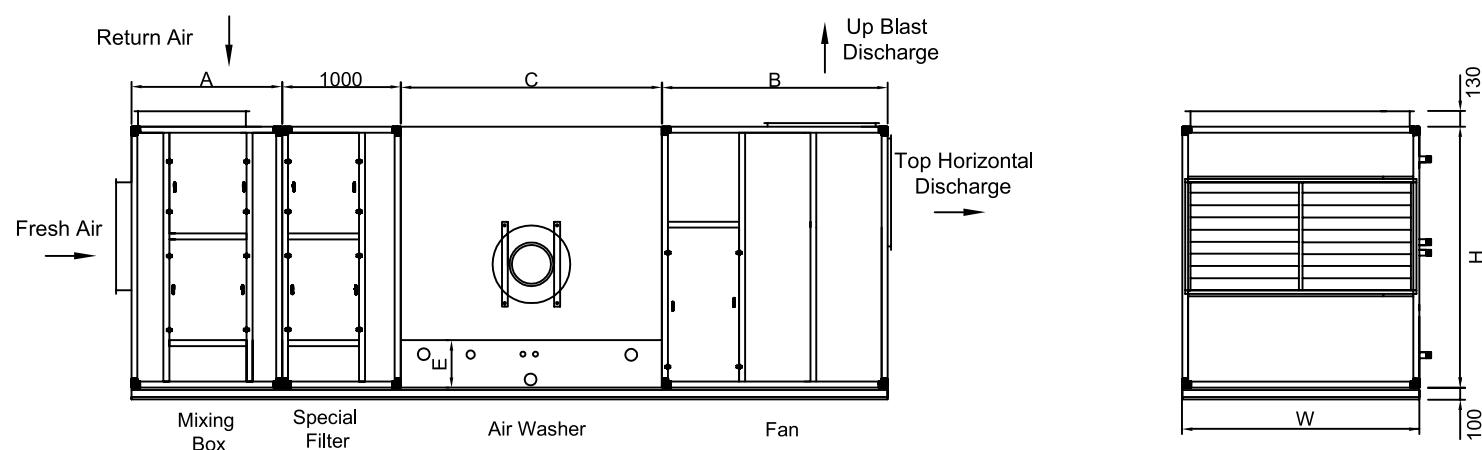

$$\text{Leaving Air DB Temp.} = \text{Entering Air DB Temp.} - \text{Air washer efficiency} \times (\text{Entering Air DB Temp.} - \text{Entering Air WB Temp.})$$

$$\text{Leaving Air DB Temp.} = 95 - 0.898 \times (95 - 63) = 66.3^{\circ}\text{F}$$

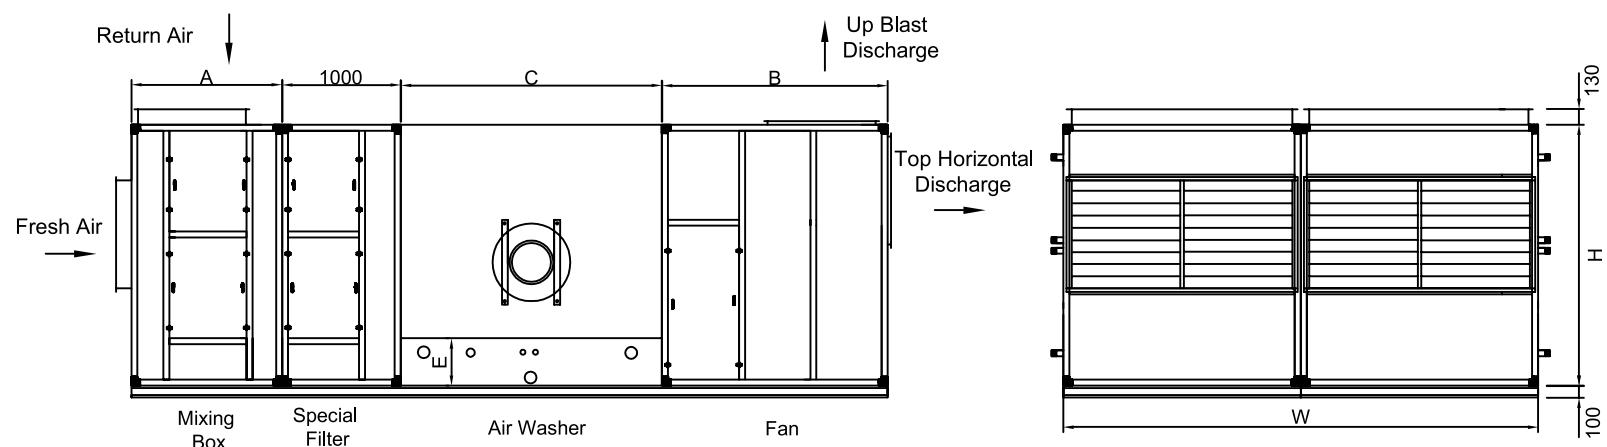

$$\text{Sensible cooling load} = 1.085 \times \text{Air Density factor (Table 27)} \times \text{Air Flow Rate(CFM)} \times (\text{Entering Air DB Temp.} - \text{Leaving Air DB Temp.})$$

$$\text{Sensible cooling load} = 1.085 \times 10000 \times (95-66.3) = 309960 \text{ Btu/hr}$$

NOTE

- All dimensions are in mm.
- Weights are based on default air washer equipment.

APPENDIX 2 - Air Filters Types and Classification

Aluminum Washable Filters

The Metal Washable Panel Air Filter is a coarse filter suitable for ventilation and air conditioning systems, where clean ability is required and low efficiency filtration can be accepted. Washable air filter is suitable for use at higher air velocities, and hence when dealing with large air volumes. The metal washable panel filter is noncombustible and is therefore especially suited to applications where fire is a potential hazard.

As standard, Saran Air handling units equipped with Aluminum washable filters, which the air filtration media is crimped aluminum knitted wire mesh and enclosed in either a galvanized channel frame (Aluminum and stainless steel frame available upon request). Stainless steel metal washable air filters are also available in a grid mesh style filter or alternatively panels with galvanized media with stainless steel frames, to offer a long lasting product resistant to harsh atmospheres.

Pleated Panel Filters

The Pleated Panel Air Filter is a medium efficiency disposable air filter, suitable for ventilation and air conditioning systems which require a higher efficiency and greater dust holding capacity than can be achieved with glass or synthetic panels. The EU4 filter can be used where glass panels are undesirable, such as in the food industry and hospitals. Typically EU4 panel filters are used as pre filters on supply air systems to High Performance Bag Filters, or to protect heating or cooling coils from dust build up which leads to system inefficiency. Generally, Pleated filters used in class range of EU3 to EU5.

Bag Filters

The Multi-Pocket Bag Filter is a high efficiency filter and is designed for a wide range of air conditioning and general ventilation applications where large volumes of air are to be handled, and systems dictate high dust holding capacity, coupled with a low resistance.

High performance bag filters are available in five efficiency grades, which gives a choice of characteristics to meet customer requirements for dust holding capacity, efficiencies and pressure loss. Generally, Bag filters used in class range of EU6 to EU9.

V-Cell Compact Filters

V-Cell Compact Filters have all features of bag filters but The V-Cell allowing a high filtering flow in relation to the front surface area.

This equipment has the following advantages:

- Solid, sturdy construction for fast, easy installation.
- Compact, reduced-volume design.

Generally, V-Cell Compact Filters used in class range of EU6 to EU9.

HEPA and ULPA Filters

HEPA Filters are installed where the highest level of air filtration is required in applications such as clean rooms, operating theatres, research facilities, the electronics industries, nuclear and pharmaceutical industries.

The filtration medium is provided by microfine glass fibers formed into a paper-like surface, supplied in various grades depending upon filtration efficiency required. The filter paper is formed into a close pleated package to provide a large surface area. Generally, V-Cell Compact Filters used in class range of EU10 to EU14.

APPENDIX 2 - Air Filters Types and Classification (Cont.)

Table 29: Classification of coarse and fine filters according to CEN EN 779 and EU 4/5

Type of filter	Particule Size, μm	CEN EN 779 Efficiency Class	Average Arrestance With Synthetic Dust (Am%)	Average Opacimetric Efficiency (Em%)	Final Pressure drop (Pa)	Eurovent 4/5 Efficiency Class
