Angular contact ball bearings have inner and outer ring raceways that are displaced relative to each other in the direction of the bearing axis. This means that these bearings are designed to accommodate combined loads, i.e. simultaneously acting radial and axial loads.

The axial load carrying capacity of angular contact ball bearings increases as the contact angle increases. The contact angle is defined as the angle between the line joining the points of contact of the ball and the raceways in the radial plane, along which the combined load is transmitted from one raceway to another, and a line perpendicular to the bearing axis (**fig. 1**).

The most commonly used designs are:

- single row angular contact ball bearings (**fig. 2**)
- double row angular contact ball bearings (**fig. 3**)
- four-point contact ball bearings (**fig. 4**)

In addition to the bearings presented in this catalogue, other angular contact ball bearings include:

- **Super-precision angular contact ball bearings**

→ [skf.com/super-precision](http://skf.com/super-precision)

- **Fixed section angular contact ball bearings**

These bearings have very thin rings and a constant cross-sectional height within a particular series, irrespective of the bearing size. They are characterized by a low weight and high stiffness. SKF fixed section bearings have inch sizes and are available open or sealed in up to eight different cross-sectional heights.

The designs include:

- single row angular contact ball bearings
- four-point contact ball bearings

Fig. 1 Contact angle  $\alpha$  - load transmission

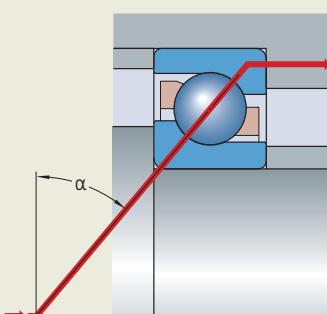

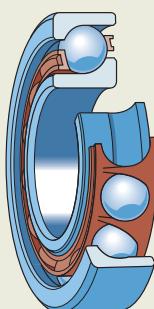

Fig. 2 Single row bearing

### • Hub bearing units

Hub bearing units (HBU) for the automotive industry are based on double row angular contact ball bearings. They have made an appreciable contribution to the achievement of more compact weight-saving designs, simplified assembly and enhanced reliability.

Detailed information about these products and variants for industrial applications can be supplied on request.

## Bearing features

### • Accommodate combined loads

- Axial loads in one direction only for single row bearings
- Axial loads in either direction for double row and four-point contact bearings

### • High load carrying capacity

- The lower shoulder enables a large number of balls to be incorporated in single row bearings, giving them their relatively high load carrying capacity.
- Because of the second row of balls, a large number of balls are incorporated in double row bearings, giving them their high load carrying capacity.
- A large number of balls are incorporated in four-point contact bearings, giving them their high load carrying capacity.

### • Good running properties

High speeds, rapid accelerations and decelerations are possible.

# Designs and variants

## Single row angular contact ball bearings

SKF single row angular contact ball bearings (**fig. 2**) can accommodate axial loads in one direction only. This type of bearing is typically adjusted against a second bearing. Their bearing rings have an upper and a lower shoulder and are non-separable.

### SKF standard assortment

- bearings in the 72 B(E) and 73 B(E) series with 40° contact angle
- some sizes in the 70 B series
- sealed bearings:
  - in series 72 B(E) ( $15 \leq d \leq 55$  mm)
  - in series 73 B(E) ( $12 \leq d \leq 50$  mm)
- bearings in the 72 AC series with 25° contact angle ( $15 \leq d \leq 70$  mm)
- bearings in the 73 AC series with 25° contact angle ( $17 \leq d \leq 70$  mm)
- some large size bearings with a flanged outer ring ([skf.com/go/17000-3-1](http://skf.com/go/17000-3-1))
- SKF inch bearings (ALS and AMS series, [skf.com/go/17000-3-1](http://skf.com/go/17000-3-1))

## Basic design bearings

- are intended for adjusted arrangements where only one bearing is used at each bearing position and are not suitable for mounting immediately adjacent to each other
- have Normal tolerances on bearing width and standout of the rings
- have different performance capabilities compared with SKF Explorer bearings

## Bearings for universal matching

- are available with 25° and 40° contact angles
- are intended to be used in sets
- have ring widths and standouts manufactured to tight tolerances
- can also be used in place of basic design bearings for arrangements with single bearings, as they typically have higher precision, and increased load carrying capacity and speed capability

When two bearings are mounted immediately adjacent to each other, a given internal clearance or preload or an even load distribution between the two bearings is obtained without the use of shims or similar devices.

Bearings for universal matching are identified by the following suffixes:

- CA, CB, CC or G for internal clearance
- GA, GB or GC for preload

When ordering, indicate the number of individual bearings required and not the number of sets.

Fig. 3

### Double row bearing

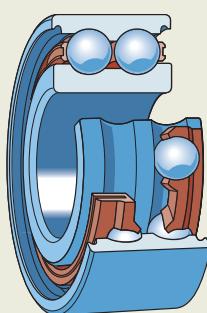

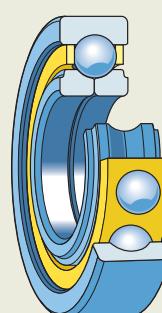

Fig. 4

### Four-point contact bearing

### 3 Angular contact ball bearings

#### Paired mounting

Paired mounting can be done in three ways (fig. 5):

##### • Tandem arrangement

- is used where the load carrying capacity of a single bearing is inadequate
- shares the radial and axial loads equally
- has parallel load lines
- can accommodate axial loads in one direction only

If axial loads act in both directions, a third bearing, adjusted against the tandem pair, must be added.

##### • Back-to-back arrangement

- provides a relatively stiff bearing arrangement
- can accommodate tilting moments
- has load lines that diverge from the bearing axis
- can accommodate axial loads in both directions, but only by one bearing in each direction

##### • Face-to-face arrangement

- is less sensitive to misalignment but not as stiff as a back-to-back arrangement
- has load lines that converge towards the bearing axis
- can accommodate axial loads in both directions, but only by one bearing in each direction

#### Bearings with 25° contact angle (AC series)

- have a raceway geometry optimized for high speeds
- have reduced sensitivity to axial loading and misalignment, including the ability to accommodate two times higher impact loads before edge stresses can occur
- are equipped with an optimized machined brass cage as standard

Compared with bearings with 40° contact angle, benefits include:

- 20% higher limiting speeds
- higher radial load carrying capacity (by trading off lower axial load carrying capacity)
- increased robustness when used as the backup bearing in sets that are predominantly loaded in one direction

#### Double row angular contact ball bearings

The design of SKF double row angular contact ball bearings (fig. 3, page 385) corresponds to two single row angular contact ball bearings arranged back-to-back, but takes up less axial space. They can accommodate radial loads, axial loads in either direction and tilting moments. Double row angular contact ball bearings provide stiff bearing arrangements.

#### SKF standard assortment

- bearings in the 32 A and 33 A series
- bearings with a two-piece inner ring
- capped bearings
- open bearings (that are also available capped) that may have recesses in the ring side faces

Bearings in the 52 and 53 series are no longer available and have been replaced with 32 A and 33 A series bearings, which are dimensionally interchangeable. Only size 3200 A is different, and has a width of 14 mm instead of 14,3 mm.

#### Basic design bearings

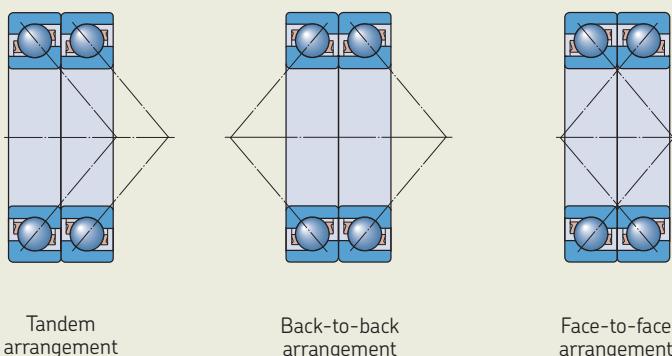

- have different tolerances and performance capabilities compared with SKF Explorer bearings

#### Bearings with a two-piece inner ring

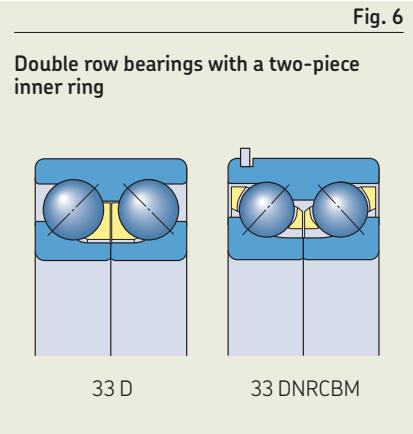

- incorporate a larger number of balls, and have a larger contact angle, giving the bearing its high load carrying capacity, especially in the axial direction
- are separable in the 33 D series (fig. 6), i.e. the outer ring with ball and cage assemblies can be mounted independently of the inner ring halves
- are non-separable in the 33 DNRCBM series (fig. 6)
  - have a snap ring groove with a snap ring in the outer ring, enabling simple and space-saving axial location in the housing
  - have been designed specifically for centrifugal pumps, but can also be used in other applications

Paired mounting

Fig. 5

Double row bearings with a two-piece inner ring

# Four-point contact ball bearings

Four-point contact ball bearings (fig. 4, page 385) are radial single row angular contact ball bearings with raceways that are designed to support axial loads in both directions. For a given axial load, a limited radial load can also be supported (Load ratio, page 403). The bearings are separable, i.e. the outer ring with ball and cage assembly can be mounted separately from the two inner ring halves.

These bearings take up considerably less axial space than double row bearings.

Both inner ring halves of SKF Explorer four-point contact ball bearings have a recessed shoulder. This improves oil flow when the bearing is used in combination with an SKF cylindrical roller bearing (fig. 12, page 403). In addition, these recesses can be used to facilitate dismounting.

When four-point contact ball bearings are subjected to high clamping forces their inner ring deformation is limited.

## SKF standard assortment

- bearings in the QJ 2 and QJ 3 series
- some sizes in the QJ 10 and QJ 12 series ([skf.com/go/17000-3-4](http://skf.com/go/17000-3-4))

## Bearings with locating slots

Four-point contact ball bearings can be supplied with two locating slots in the outer ring (designation suffix N2, fig. 7):

- preventing the bearing from turning
- positioned 180° apart

The dimensions and tolerances of the locating slots are in accordance with ISO 20515 and are listed in **table 1**.

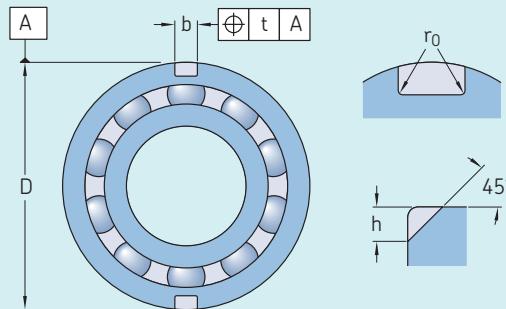

## SKF Explorer bearings

For information, refer to [page 7](#)

<sup>1)</sup> Other tolerances are in accordance with ISO 20515.

**Fig. 7**

Four-point contact bearing with locating slots

# Capped bearings

SKF supplies the following angular contact ball bearings capped with a shield or seal on both sides:

- single row bearings in the 72 B(E) and 73 B(E) series:
  - non-contact seals (designation suffix 2RZ, [fig. 8](#))
- most common double row basic design and SKF Explorer bearings:
  - shields (designation suffix 2Z, [fig. 9](#))
  - contact seals (designation suffix 2RS1, [fig. 10](#))

For additional information, refer to *Integral sealing, page 26*.

When capped bearings must operate under certain conditions, such as very high speeds or high temperatures, grease may appear between the inner ring and capping device. For bearing arrangements where this would be detrimental, appropriate actions should be taken.

3

## Shields

- are made of sheet steel
- extend into a recess on the inner ring

## Non-contact seals

- have no additional frictional moment
- have the same limiting speeds as open bearings
- form an extremely narrow gap with the inner ring shoulder
- are made of sheet steel reinforced NBR (oil and wear-resistant)
- make good, positive contact with the recess in which they are fitted

## Contact seals

- are made of NBR
- are reinforced with a sheet steel insert
- are fitted in a recess on the outer ring and make good, positive contact with the recess
- have a lip that exerts light pressure against the recess on the inner ring to provide an effective seal

Fig. 8

Capped bearing – non-contact seals

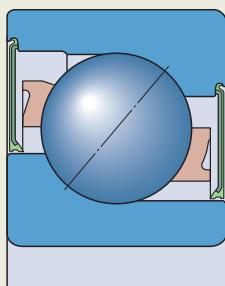

Fig. 9

Capped bearing – shields

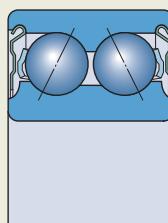

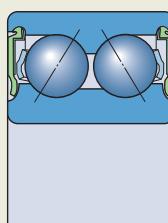

Fig. 10

Capped bearing – contact seals

## Greases for capped bearings

Bearings capped on both sides are lubricated for the life of the bearing and are virtually maintenance-free. They are filled with one of the following greases ([table 2](#)):

- single row bearings
  - as standard → GXN
- double row bearings
  - as standard → GJN
  - in Europe → MT33 (commonly used and widely available)
  - low-friction grease → GE2
- other greases ([table 2](#)) can be supplied on request

The standard grease is not identified in the bearing designation (no designation suffix).

Other greases are indicated by the corresponding grease suffix.

## Grease life for capped bearings

Grease life for capped angular contact ball bearings can be estimated as described for deep groove ball bearings ([page 246](#)). The required grease information is provided in [table 2](#).

3

Table 2

### Technical specifications of SKF standard and special greases for capped angular contact ball bearings

| Grease | Temperature range <sup>1)</sup> |   |    |     |     |     |     | Thickener       | Base oil type         | NLGI grade | Base oil viscosity<br>[mm <sup>2</sup> /s] | Grease performance factor (GPF) |   |

<sup>1)</sup> Refer to the SKF traffic light concept ([page 117](#)).

# Cages

SKF angular contact ball bearings are fitted with one or two (double row bearings) of the cages shown in [table 3](#).

The standard cages of double row bearings are either made of PA66 or of stamped steel.

The machined brass cage (designation suffix M) of single row bearings has been upgraded as follows:

- optimized cage pocket geometry
- a smaller cross section and reduced mass
- increased material strength with reduced lead content

When used at high temperatures, some lubricants can have a detrimental effect on polyamide cages. For additional information about the suitability of cages, refer to *Cages*, [page 187](#).

3

## Calculating the axial load for bearings mounted singly or paired in tandem

When a radial load is applied to a single row angular contact ball bearing, the load is transmitted from one raceway to the other at an angle to the bearing axis and an internal axial load is induced. This must be considered when calculating the equivalent bearing loads for bearings in adjusted arrangements consisting of two single bearings and/or bearing pairs arranged in tandem.

The equations ([table 11](#)) are only valid if the bearings have identical contact angles and are adjusted against each other to practically zero clearance, but without any preload. In the table, bearing A is subjected to a radial load  $F_{rA}$  and bearing B to a radial load  $F_{rB}$ . Both  $F_{rA}$  and  $F_{rB}$  are always considered positive, even when they act in the direction opposite to that shown in the figures. The radial loads act at the pressure centres of the bearings (distance  $a$ , refer to [product tables, page 406](#)).

These calculations can easily be done with SKF's online calculation tools. When the bearings are adjusted with clearance or preload, or when bearings with different contact angles are used, the equations become more complex and can be done using the SKF SimPro platform ([skf.com/simpro](http://skf.com/simpro)).

## Load carrying capacity of bearing pairs

The values for basic load ratings and fatigue load limits listed in the [product tables, page 406](#), apply to single bearings. For bearing pairs mounted immediately adjacent to each other, the following values apply:

- basic dynamic load rating for standard bearings in all arrangements and for SKF Explorer bearings in a back-to-back or face-to-face arrangement  
 $C = 1,62 C_{\text{single bearing}}$
- basic dynamic load rating for SKF Explorer bearings in a tandem arrangement  
 $C = 2 C_{\text{single bearing}}$
- basic static load rating  
 $C_0 = 2 C_0 \text{ single bearing}$
- fatigue load limit  
 $P_u = 2 P_u \text{ single bearing}$

|   | <b>Case 1c</b>                                      |  |
|   | $F_{rA} < F_{rB}$<br>$K_a < R (F_{rB} - F_{rA})$    | $F_{aA} = F_{aB} - K_a$<br>$F_{aB} = R F_{rB}$ |
| <b>Back-to-back</b>   | <b>Case 2a</b>                                      |  |
|  | $F_{rA} \leq F_{rB}$<br>$K_a \geq 0$                | $F_{aA} = F_{aB} + K_a$<br>$F_{aB} = R F_{rB}$ |
| <b>Face-to-face</b>   | <b>Case 2b</b>                                      |  |
|  | $F_{rA} > F_{rB}$<br>$K_a \geq R (F_{rA} - F_{rB})$ | $F_{aA} = F_{aB} + K_a$<br>$F_{aB} = R F_{rB}$ |
|   | <b>Case 2c</b>                                      |  |
|   | $F_{rA} > F_{rB}$<br>$K_a < R (F_{rA} - F_{rB})$    | $F_{aA} = R F_{rA}$<br>$F_{aB} = F_{aA} - K_a$ |

- For bearings with:
- 20° contact angle →  $R = 0,50$
  - 25° contact angle →  $R = 0,57$
  - 30° contact angle →  $R = 0,66$
  - 40° contact angle →  $R = 0,88$

# Temperature limits

The permissible operating temperature for angular contact ball bearings can be limited by:

- the dimensional stability of the bearing rings and balls
- the cage
- the seals
- the lubricant

Where temperatures outside the permissible range are expected, contact SKF.

## Bearing rings and balls

The bearings are heat stabilized up to at least 150 °C (300 °F).

## Cages

Steel, brass or PEEK cages can be used at the same operating temperatures as the bearing rings and balls. For temperature limits of cages made of other polymer materials, refer to *Polymer cages, page 188*.

## Seals

The permissible operating temperature for NBR seals is –40 to +100 °C (–40 to +210 °F). Temperatures up to 120 °C (250 °F) can be tolerated for brief periods.

Typically, temperature peaks are at the seal lip.

## Lubricants

Temperature limits for greases used in sealed SKF angular contact ball bearings are provided in *table 2, page 389*. For temperature limits of other SKF greases, refer to *Selecting a suitable SKF grease, page 116*.

When using lubricants not supplied by SKF, temperature limits should be evaluated according to the SKF traffic light concept (*page 117*).

# Permissible speed

The speed ratings in the [product tables](#) indicate:

- the **reference speed**, which enables a quick assessment of the speed capabilities from a thermal frame of reference
- the **limiting speed**, which is a mechanical limit that should not be exceeded unless the bearing design and the application are adapted for higher speeds

For additional information, refer to *Operating temperature and speed, page 130*.

SKF recommends oil lubrication for bearings with a ring centred cage (designation suffix MA or PHAS). When these bearings are grease lubricated, the  $nd_m$  value is limited to 250 000 mm/min.

where

$$d_m = \text{bearing mean diameter [mm]}$$

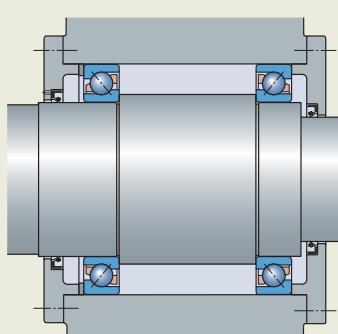

$$= 0,5 (d + D)$$

$$n = \text{rotational speed [r/min]}$$

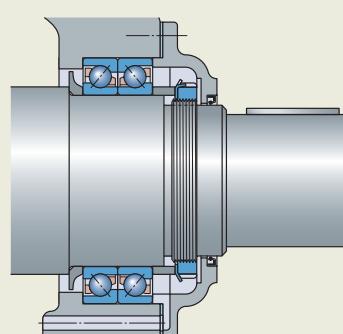

## Bearing pairs

For bearings arranged in pairs, the limiting speed should be reduced to approximately 80% of the value quoted for a single bearing.

### Proper adjustments

Single bearing,  
face-to-face

Bearing set,  
back-to-back

Fig. 11

# Design considerations

## Single row angular contact ball bearings

### Proper adjustment

Single row angular contact ball bearings must be used ([fig. 11](#)):

- with a second bearing
- in sets

The bearings must be adjusted against each other until the requisite clearance or preload is obtained (*Selecting preload, page 186*).

Universally matchable bearings mounted immediately adjacent to each other:

- require no further adjustment (*Bearings for universal matching, page 385*)
- obtain requisite clearance or preload by:
  - choosing bearings from an appropriate clearance or preload class
  - applying suitable fits for the bearings on the shaft and in the housing

Performance and operational reliability depend on:

- proper adjustment for single bearings
- the correct selection of clearance and preload for universally matchable bearings

If there is too much clearance in the bearing arrangement during operation, the load carrying capacity of the bearings will not be fully utilized. Excessive preload produces more friction and higher operating temperatures, leading to a reduction in bearing service life.

### Axial loads in one direction

When the axial load acts predominantly in one direction in back-to-back and face-to-face arrangements, unfavourable rolling conditions for the balls of the axially unloaded bearing may occur, which can lead to:

- increased noise levels
- discontinuity in the lubricant film
- increased stresses on the cage

Under these circumstances, SKF recommends zero operating clearance, which can be attained by using springs. When springs are not sufficient, using bearings with a 25° contact angle as a backup bearing may help.

### Load ratio

- of  $F_a/F_r \geq 1$  is required by bearings in the 70 B, 72 B(E) and 73 B(E) series
- of  $F_a/F_r \geq 0,55$  is required by bearings in the 72 AC and 73 AC series

If the load ratio requirement is not met in each case, bearing service life can be reduced.

# Four-point contact ball bearings

## Used as a thrust bearing

Four-point contact ball bearings are often used as entirely thrust bearings, together with a radial bearing. When used in this way, the four-point contact ball bearing should be mounted with radial clearance in the housing ([fig. 12](#)).

- in combination with a cylindrical roller bearing:
  - the radial internal clearance of the cylindrical roller bearing should be smaller than the theoretical radial internal clearance of the four-point contact ball bearing after both have been mounted
  - the theoretical radial clearance can be calculated from:

$$C_r = 0,7 C_a$$

where

$C_r$  = theoretical radial internal clearance  
 $C_a$  = axial internal clearance ([table 9, page 397](#))

- the outer ring of the four-point contact ball bearing must be able to accommodate thermal movements

Therefore, it should not be clamped axially, but a small gap should be maintained between the outer ring and the cover flange.

- bearings with locating slots should be used ([fig. 12](#)) to prevent the outer ring from turning

If clamping the outer ring cannot be avoided, the outer ring must be carefully centred during mounting.

### Load ratio

For proper functionality, the balls should contact only one inner ring raceway and the opposite side of the outer ring raceway. This is the case when the load ratio is  $F_a/F_r \geq 1,27$ .

A load ratio that is smaller than recommended can reduce bearing service life.
